

WISP's need more help from the FCC for controlling RF noise in the 902Mhz-930Mhz band. We have been experiencing problems with a Local broadcasting company who owns 2 AM/1 FM stations locally. They have many tower leasers who are broadcasting in various bands. They are spraying RF noise into the radio spectrum in the 902-930Mhz band. When we contacted them they felt the band was a "junk band", I told the engineer that it wouldn't be junk if broadcasters didn't spray spurious power into the band. The FCC should tell Paging, Cellular, and others that they CAN NOT have equipment that sprays into these bands set aside for wireless internet service. This really hinders the ability to serve the public with a needed service.
